Resilience and Water Security in Two Australian Regional Cities

The report explores the adaptive capacity of two Australian regional cities (Kalgoorlie in Western Australia and Broken Hill in New South Wales) facing different challenges relating to climate change and water security. It develops a resilient regions assessment process to produce a complex adaptive systems framework to evaluate water issues. The report provides a range of water security future scenarios that could assist in planning for and adapting to climate change in the two cities.

Quantifying Vulnerability to Climate Change

This paper quantifies the vulnerability of 233 countries to three major effects of climate change (weather-related disasters, sea-level rise, and reduced agricultural productivity). It develops a methodology for donors and others to craft cost-effective assistance for climate adaptation. The paper includes two sample applications: assistance for the 20 island states to adapt to sea-level rise; and general assistance for all low-income countries to adapt to extreme weather changes, sea-level

rise, and reduced agricultural productivity.

Weighing the Human Costs of Disasters

The paper reviews the costs and psychological consequences of disasters for individuals, families, and communities. It proposes five key points: disasters cause serious psychological harm in a minority of exposed individuals; disasters produce multiple patterns of outcome; disaster outcomes depend on a combination of risk and resilience factors; disasters put families, neighborhoods, and communities at risk; and the remote effects of a disaster in unexposed populations are generally limited and transient.

Adaptation, Mitigation and Risk-Taking in Climate Policy

The paper discusses the contributions to global mitigation in a model with risk-taking behaviour. It extends the model by allowing for adaptation as a second strategy of climate policy. The paper considers that adaptation in climate policy is beneficial for a single country not only because it reduces the risk from climate change, but also because it affects the behavior of other countries.

Vietnam's Climate Change Strategy - Procedural Critique

This article asks through what processes and for which interests the emerging Vietnamese climate change strategy is being designed, and if, ultimately, it is likely or not to be effective in the face of the looming threat. It argues that the strategy provides an illusion of intervention and security, but largely fails to identify and mitigate the underlying causes of climate change, or to lay the ground for a robust mid- and long-term adaptation strategy.

World Planning Schools Congress 2011 - Perth, Western Australia

This congress (WPSC 2011) will take place from 4-8 July 2011 in Perth, Western Australia. It features a total of 20 planning tracks, including: climate change, risk, adaptation, and planning.

Professor Darryn McEvoy, Leader of the Climate Change Adaptation Programme at RMIT University, amongst others, will co-convene a session on 'planning for a changing climate' at the WPSC 2011. For registration and other details, please go to the congress website below.
