Surface Urban Heat Island Effect in Central Sydney

The City of Sydney is increasingly experiencing the UHI (Urban Heat Island) effect due to its numerous urban development projects and changes in climate. In this context, the paper explores the most heat resilient urban features at precinct scale. It covers five high density precincts (based on a nocturnal remote-sensing thermal image) in central Sydney. The paper argues that the higher UHI effect in precinct scale correlates with more hard-landscaped public space plot ratio, more street network intensity and less urban greenery plot ratio.

Neonates in Ahmedabad, India, During the 2010 Heat Wave

This study compares neonatal morbidity in a non-air-conditioned hospital during the 2010 heat wave in Ahmedabad (India) to morbidity in the prior and subsequent years. It supports the hypothesis that neonatal morbidity increases in non-climate-controlled settings during periods of extreme high ambient temperatures. The paper demonstrates the importance of simple surveillance measures in motivating a hospital policy change toward climate change adaptation.

Economic Impact Assessment, Climate Change & Key Sectors

The report estimates the potential impacts and economic costs of climate change for three major risk areas (agriculture, hydroelectricity, water-induced disasters) and identifies climate compatible development options in response to these risks. The report develops an iterative climate change adaptation pathway that starts with current climate variability and then considers future climate change and uncertainty.

Technologies: Climate Change Adaptation

Technologies and methods for climate change adaptation are important to manage the implications of rising sea levels and more frequent and powerful rainfall. Therefore, a new online catalogue/resource of adaptation technologies has been developed, which includes practical, applied examples of climate change adaptation in three categories: normal/extreme rainfall, sea level rise and preparedness.

Heatwave Preparedness and Health Promotion - A Guide

Heatwaves in Australia result in considerable mortality and morbidity. This study develops a 'tool' to map population vulnerability to extreme heat events in large urban areas. It aims at assisting emergency managers and public health authorities, so that they may develop adaptation strategies to cope with extreme heat and provide a decision-making framework to guide future adaptation planning.

5th International Disaster and Risk Conference

5th International Disaster and Risk Conference (integrative risk management - the role of science, technology & practice) will take place in Davos, Switzerland from 24-28 August 2014. Focusing on a multi-sectors, multi-stakeholders and multi-disciplines approach, the conference aims to build stronger ties with adequate public-private partnership models among risk management communities and sectors, enabling a move towards a truly integrative way of thinking about disasters and risks.
