Climate Change Adaptation and Electricity Infrastructure

The paper sets out the scientific case for legal and technology adaptation responses in the electricity infrastructure sector in the face climate extremes and disasters. It proposes the adoption of the Smart Grid as one of the technological adaptation measures and relies on the experience of the Queensland flood disasters in Australia in 2010 to provide some generic examples of how governments and utilities might respond to protect electricity infrastructure.

Hong Kong Business Primer on Climate Change Adaptation

This report illustrates what Hong Kong business might expect from climate change, with a focus on six key industries: property, construction, financial services, manufacturing/supply chain, power generation and transport. It uncovers reasons for the current inaction, including lack of climate impact awareness, confusion between mitigation and adaptation, low risk prioritization, short-term focus and lack of forward planning. The report then elucidates sector-specific actions that can be taken to increase business resilience.

A Stronger, More Resilient New York City

The underlying goal of this report is resiliency. That is, to adapt New York City (NYC) to the impacts of climate change and to seek to ensure that when nature overwhelms city's defenses from time to time, NYC is able to recover more quickly. The report contains actionable recommendations both for rebuilding the communities impacted by Sandy and increasing the resilience of infrastructure and buildings citywide.

Health Belief Model (HBM) and Adaptive Behaviours

The study examines the usefulness of the constructs of HBM (health belief model) in predicting the adoption of healthy behaviours during heat waves. It identifies the factors that predict risk perception to heat waves and assesses participants' knowledge related to heat waves. The study argues that the health belief model could be useful to guide the design and implementation of interventions to promote adaptive behaviours during heat waves.

Cause-Specific Hospital Admissions on Hot Days

The paper analyzes hospital admissions in Sydney, Australia on unusually hot days for major disease groups and their subcategories. On a hot day, admissions increase in the broad categories of respiratory (RD), cardiovascular (CVD), mental (MD) diseases, and for diabetes (DIA), dehydration (DEH) and the 'effects of heat and light' (HEAT). The paper hypothesizes that when hospital admissions on hot days are aggregated into a large group (e.g., all CVDs) this may mask potential heat-morbidity relationships that occur for more specific outcomes.

Conference on Sustainable Development and Business in Asia

Building on the success from the last year, the 2013 Conference on Sustainable Development and Business in Asia, to be held in Bangkok-Thailand in November 2013, offers a platform for scholarly and applied conversations among a wide variety of stakeholders concerned with the continual challenge of advancing the sustainable development and business agenda: people, planet, and growth.
