Climate Change, Extreme Heat and Bushfires in WA

This report describes the background context of extreme heat and bushfires in Western Australia and how climate change is intensifying these events. It explores the impacts of fire and extreme heat on people, property, the environment and ecosystems before considering the future implications of a changing climate for fire managers, planners and emergency services.

Climate Compatible Development - India

This issue focuses on the theme of climate compatible development in India (namely, the interface between development, disaster risk reduction and climate change adaptation, which strives to initiate short and long term adaptation measures for a resilient future). Its scope ranges from Odisha's efforts to move in the direction of climate smart disaster risk management to the protection of India as a regional energy node from the onslaught of disasters.

Adaptation to Climate Change in British Local Government

This study examines how local government in Britain is making progress in adaptation to climate change. Comparing new data with similar evidence from 2003, the study shows that local authority officials now have good access to technical climate risk information. However, this knowledge is not translating into adaptation action, because of, it would seem, institutional barriers such as budget cuts and a lack of political support.

Human Cost of Natural Disasters: A Global Perspective

This report presents data about natural disasters impacts (human and economic) at a global scale for the last 20 years. The analyses focus on trends and patterns of impacts and how these vary regarding the income level or the geographical location. Based on the analyses, conclusions and action points were drawn to raise the awareness and frame the debate for the next steps that need to be done in Disaster Risk Reduction.

Australia and Climate Change Negotiations

The paper focuses on the Australian Government's strength of engagement in international climate change negotiations, rather than its choice of emissions reduction targets, domestic policies and measures, or positions on specific international issues. While substance and process are inevitably informed by, and reflect, the same set of concerns, the paper contends that regardless of its domestic policy settings Australia would benefit from stronger international engagement.

NCCARF Climate Adaptation Conference 2016

Climate Adaptation Conference 2016 is the fifth climate adaptation conference being organized by the NCCARF and CSIRO. It will take place in Australia from 5-7 July 2016. This is Australia's one of the national conferences that will focus on the information needed to ensure Australia is adapting well to climate change. The conference aims to bring together researchers, practitioners and decision makers to share knowledge and research approaches that may inform policy and practice in planning for climate change.
